MURUS Begins Video Series on Building with Structural Insulated Panels (SIPs).

The Murus Company, Inc., manufacturer of SIPs (structural insulated panels) has produced a new series of web-video case histories on the cost and energy-saving benefits of structural insulated panels for homes and light commercial buildings.

The series, called *SIPs On Site*, is designed to showcase the advantages of using SIPs in residential and commercial construction compared to traditional building methods. Each brief segment focuses on one key benefit: energy-savings, green building, and reduced construction time, among others. Homeowners, builders, developers, and architects offer their comments about their experiences with structural insulating panels for creating more efficient, comfortable and environmentally sustainable homes and buildings.

The first segment in the series highlights energy savings from the perspective of the new homeowner. Hear why SIPs was the choice for this homeowner and his wife in the design and construction of their new timberframe home.

SIPs On Site will feature new applications and benefits on an ongoing basis and can be seen at www.murus.com

The Murus Company, Inc. is a leading manufacturer of structural insulating panels (SIPs,) high performance building panels used for walls, floors, and roofs. SIPs are composite panels of interior and exterior structural sheathing with rigid, solid-core insulation.
